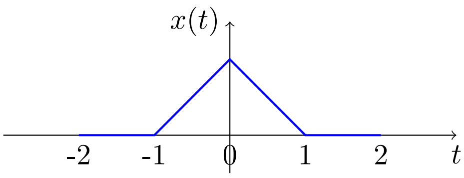
EE1101: Signals and Systems JAN—MAY 2019

Tutorial 1 Solutions

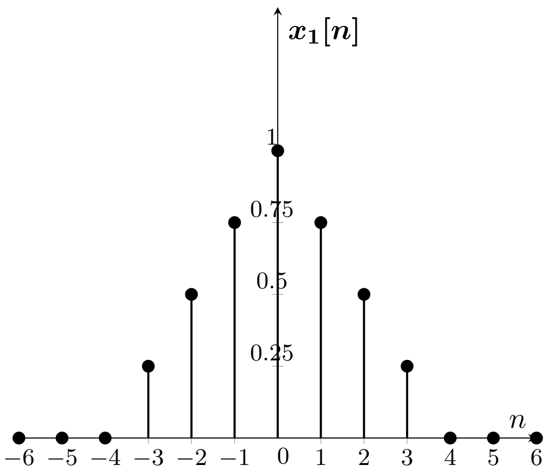
Solution 1

$$x(t) = \begin{cases} 1-|t| & -1 \le t \le 1 \\ 0 & otherwise \end{cases}$$

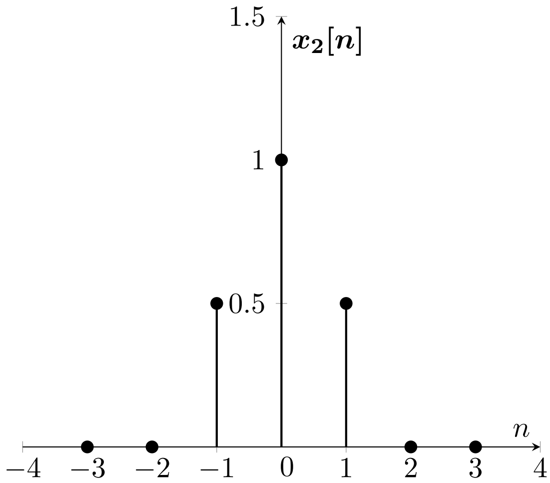
$x(t)$ is a triangular function from -1 to +1. The plot is shown below.



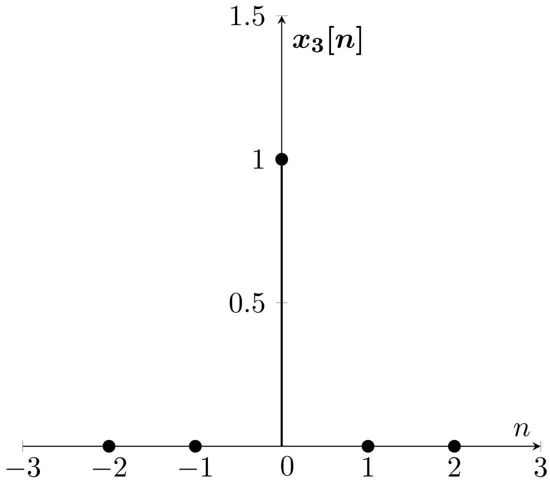
- when sampled at 0.25s, $x(t)$ becomes a discrete sequence taking values at $t = 0.25n$ where $n = 0, \pm1, \pm2, \pm3$ ... The plot is shown below.



- when sampled at 0.5s, $x(t)$ becomes a discrete sequence taking values at $t = 0.5n$ where $n = 0, \pm1, \pm2, \pm3$ ... The plot is shown below.

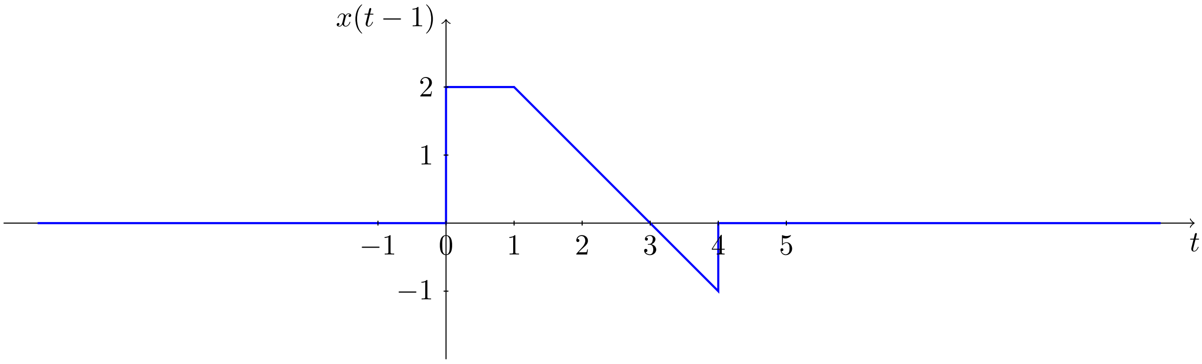


- when sampled at 1s, $x(t)$ becomes a discrete sequence taking values at $t = n$ where $n = 0, \pm1, \pm2, \pm3$... The plot is shown below.

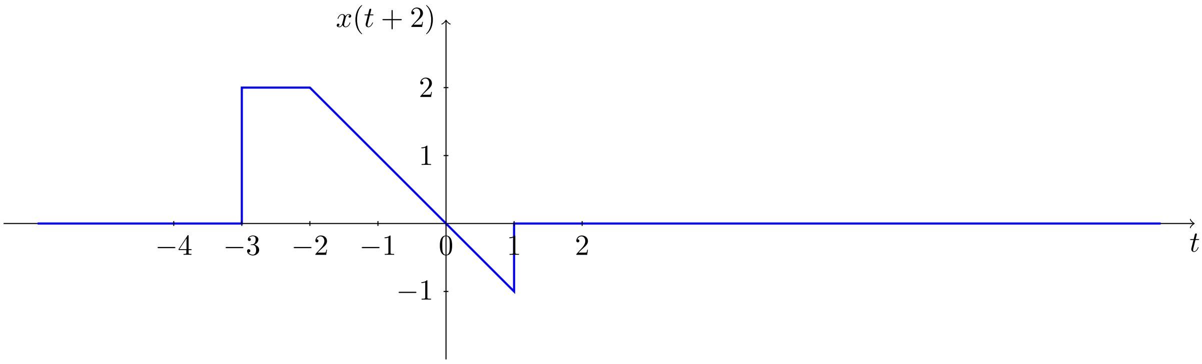


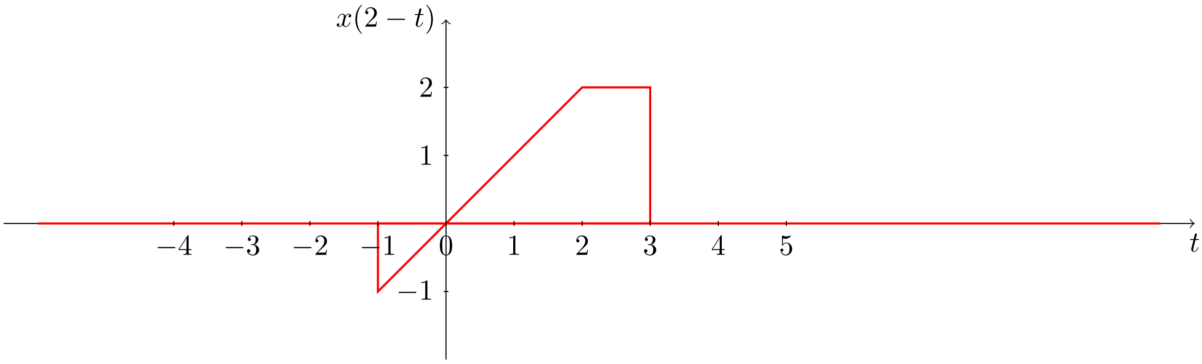
Solution 2

(a) $x(t-1)$ can be obtained by shifting $x(t)$ right by 1 unit as shown below.

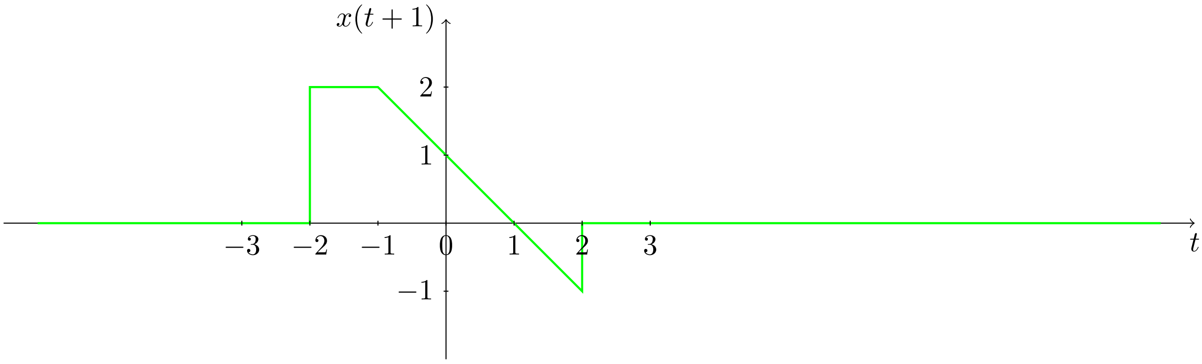


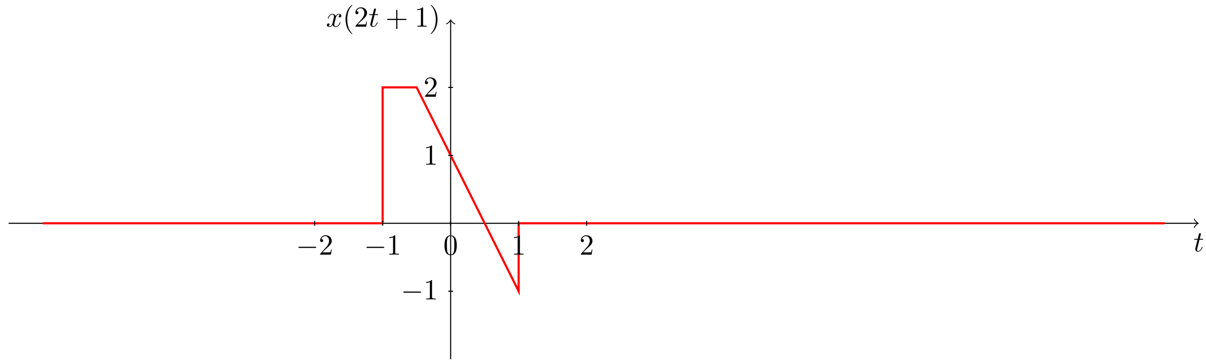
(b) $x(2-t) = x(-t+2)$ can be obtained by shifting $x(t)$ left by 2 units and then reversing the time axis as shown below.



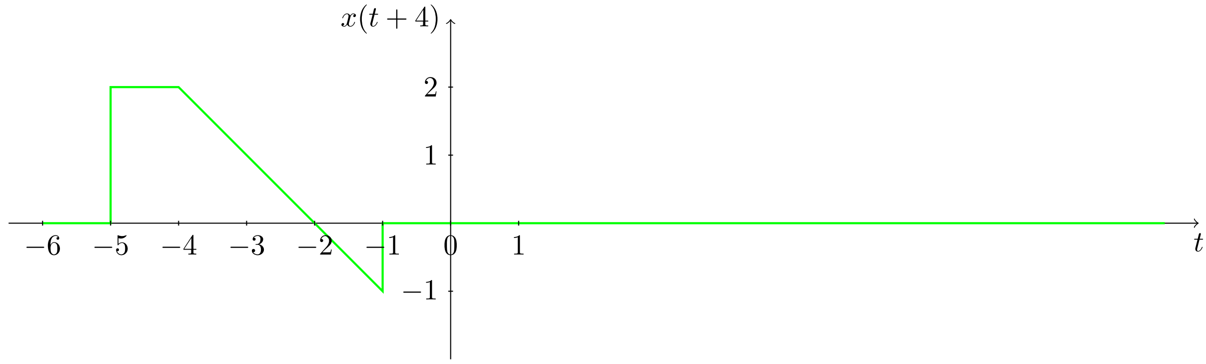


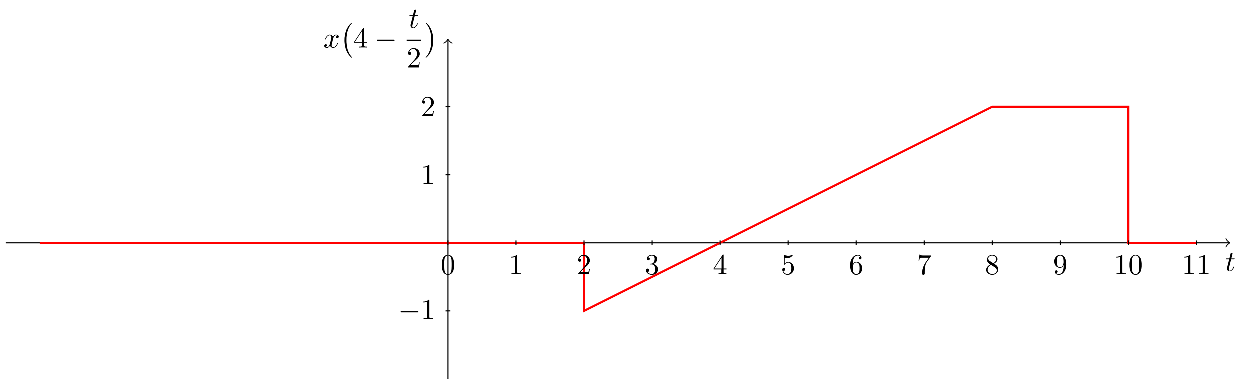
(c) $x(2t+1)$ can be obtained by shifting $x(t)$ left by 1 unit and then scaling the time axis by a factor of 2 as shown below.



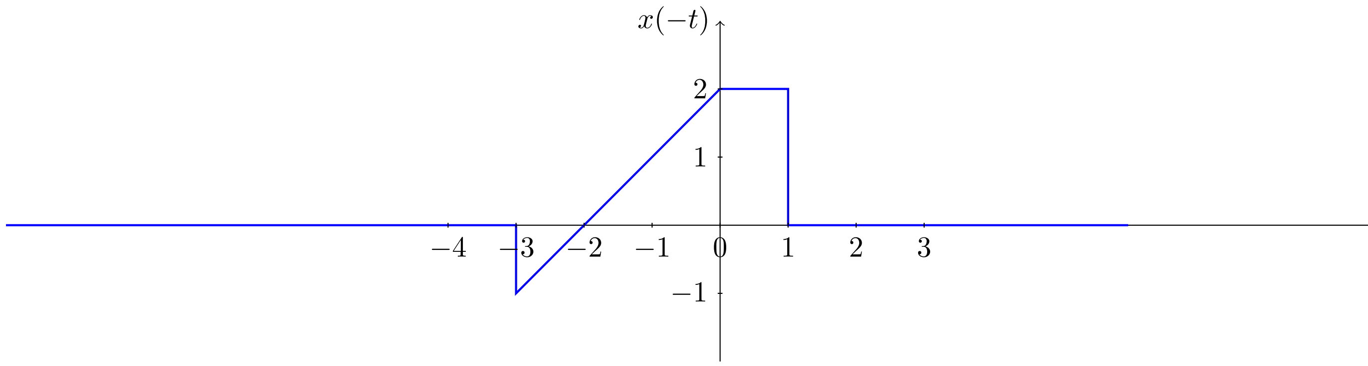


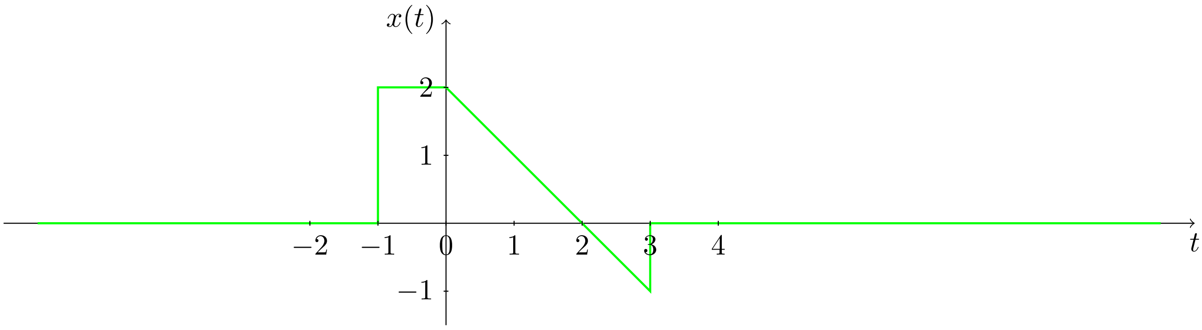
(d) $x\left(4-\frac{t}{2}\right)$ can be plotted in a similar way as shown below.

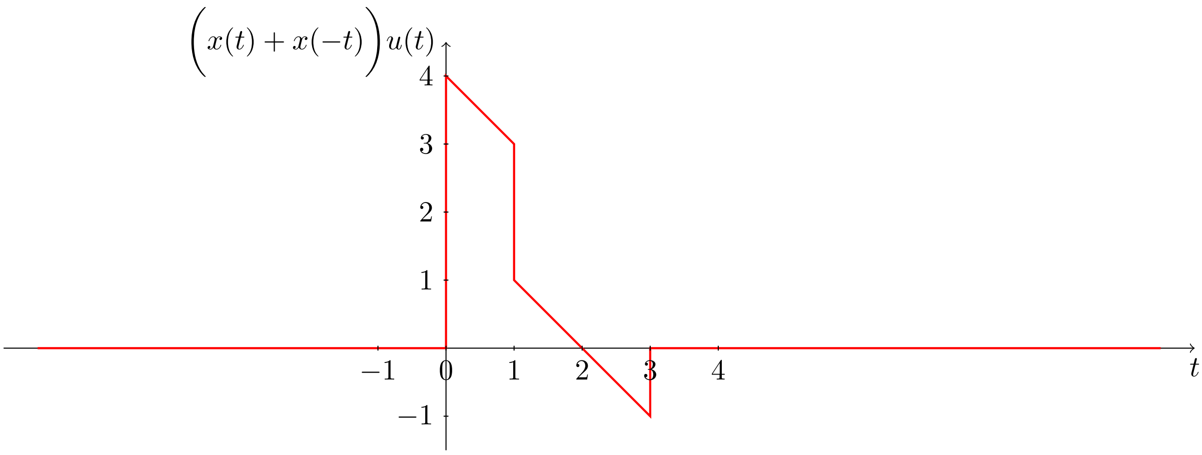




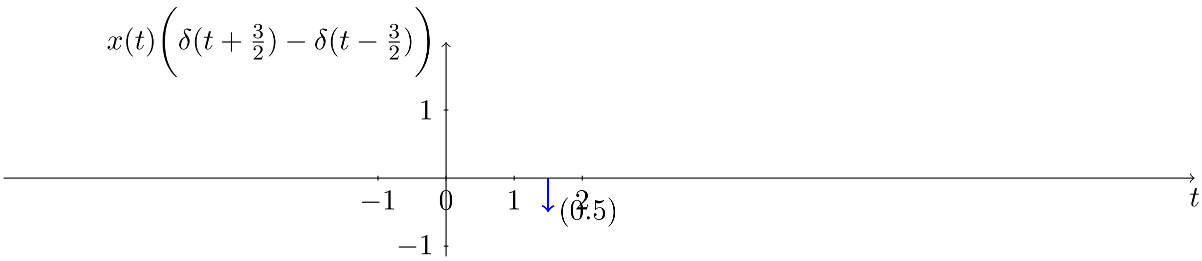
(e) The signals $x(t)$ and $x(-t)$ are added and the result is multiplied with $u(t)$, which makes the resultant signal causal.







(f) The signal $x(t)\Big(\delta(t+\frac{3}{2}) - \delta(t-\frac{3}{2})\Big)$ consists of impulse samples of the signal $x(t)$ at $t = \dfrac{3}{2}$ and $t = -\dfrac{3}{2}$.



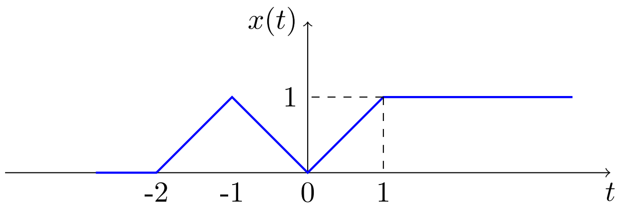
Solution 3

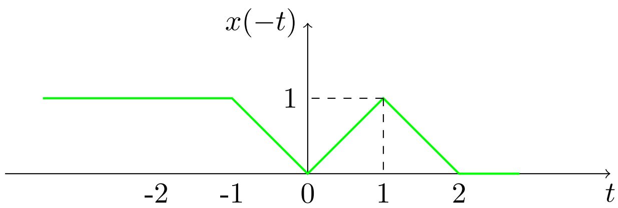
(a) The even part of a signal $x(t)$ can be calculated as

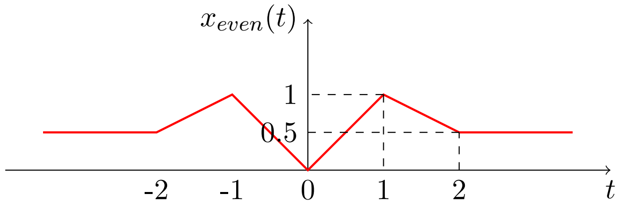
$$x_{even}(t) = \frac{x(t) + x(-t)}{2}$$

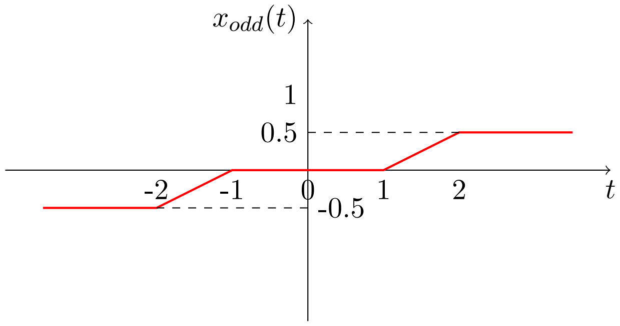
The odd part of a signal $x(t)$ can be calculated as

$$x_{odd}(t) = \frac{x(t) - x(-t)}{2}$$







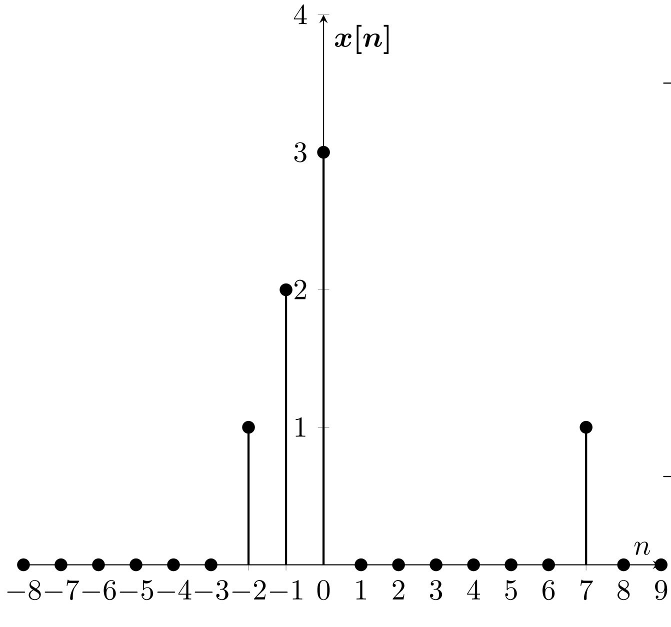


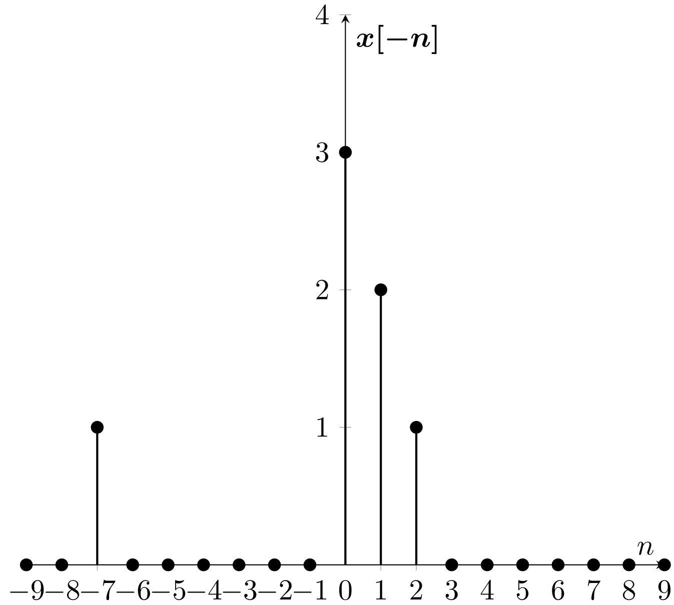
(b) The even part of a signal $x[n]$ can be calculated as

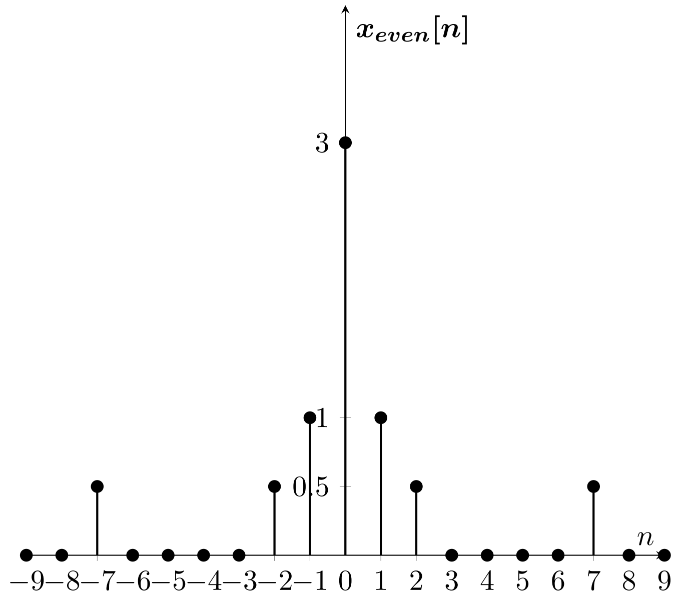
$$x_{even}[n] = \frac{x[n] + x[-n]}{2}$$

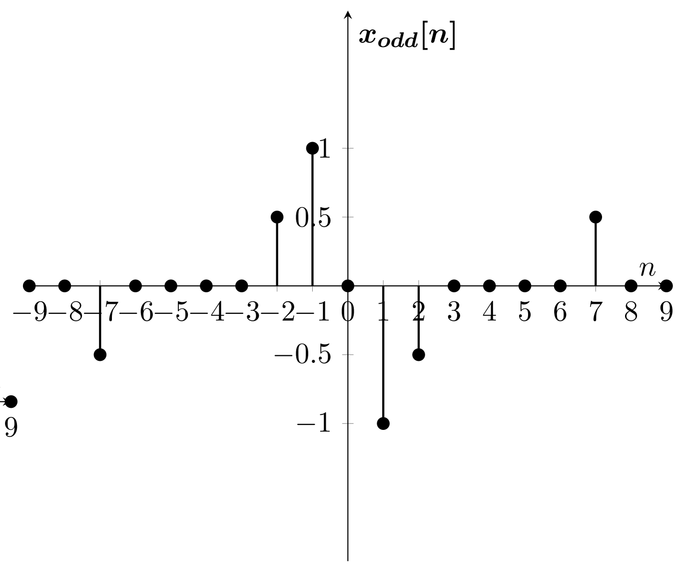
The odd part of a signal $x[n]$ can be calculated as

$$x_{odd}[n] = \frac{x[n] - x[-n]}{2}$$









Solution 4

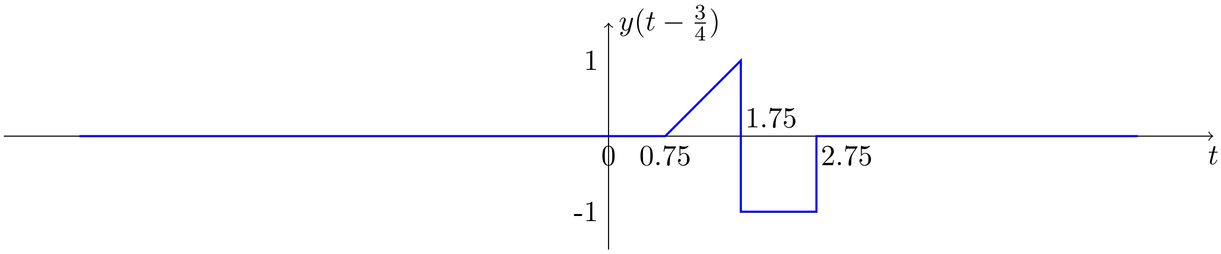
The signal $x(t)$ can be obtained from $y(t)$ through the change of variables as shown below

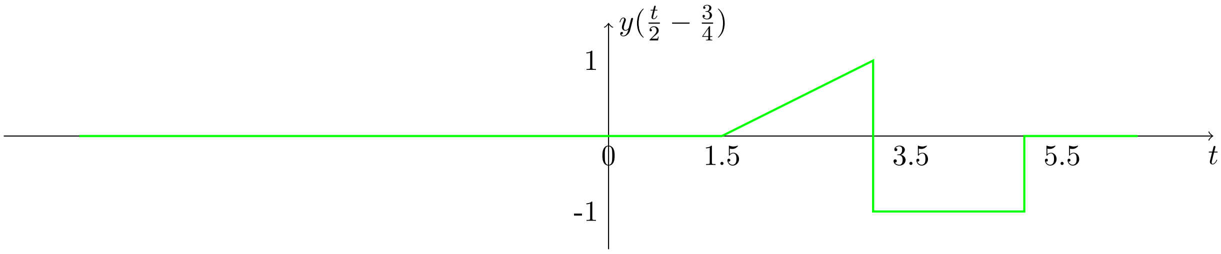
$$y(t) = \frac{-1}{2} x\Big(-2t - \frac{3}{2} \Big)$$

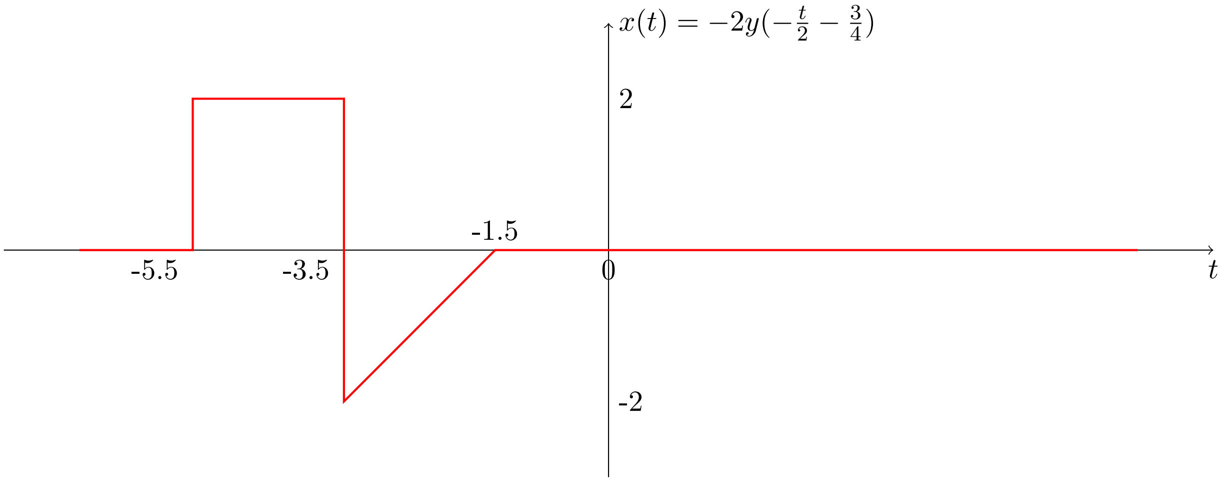
$$\text{Let} \quad t' = -2t - \frac{3}{2}$$

$$y\Big(-\frac{(t' + \frac{3}{2})}{2} \Big) = \frac{1}{2} x(t')$$

$$x(t) = -2y\Big(-\frac{t}{2} - \frac{3}{4} \Big)$$



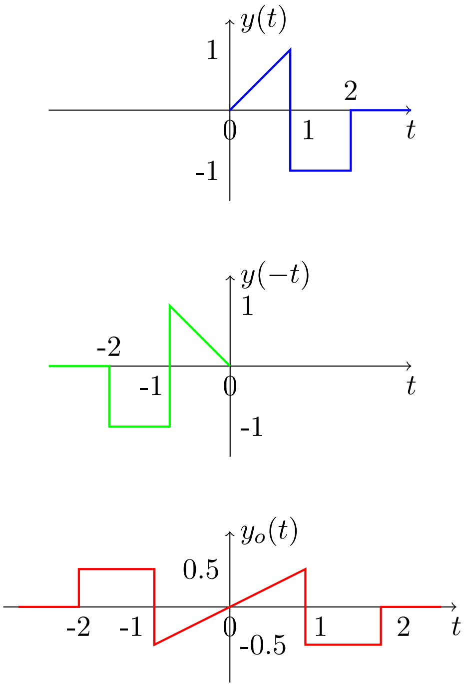




For the odd portion of $y(t)$,

$$y_o(t) = \frac{y(t) - y(-t)}{2}$$

$$y_o = \begin{cases} 0 & t < -2 \\ 0.5 & -2 \le t < -1 \\ \frac{t}{2} & -1 \le t < 1 \\ -0.5 & 1 \le t \le 2 \\ 0 & t > 2 \end{cases}$$



Solution 5

For a signal expanded as $x(t) = \sum_k A_k e^{s_k t}$ where A_k is in general complex, the complex frequency components present are the s_k's and each $s_k = \sigma_k + j\omega_k$

(a) $sin(2t) = \frac{1}{2j}(e^{2jt} - e^{-2jt})$
the complex frequencies thus are $j2$ and $-j2$.

(b) $e^{-5t}cos(3t) = \frac{1}{2}e^{-5t}(e^{3jt} + e^{-3jt}) = \frac{1}{2}(e^{(-5+3j)t} + e^{(-5-3j)t})$
the complex frequencies thus are $-5+j3$ and $-5-j3$.

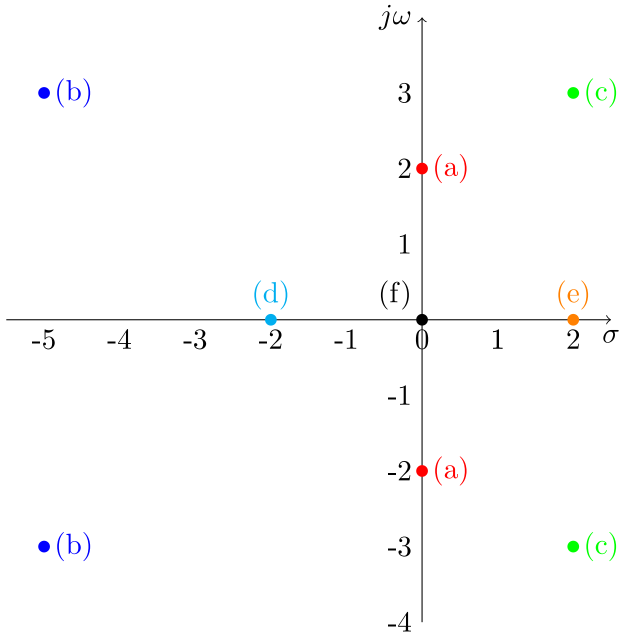
(c) $e^{2t}cos(3t) = \frac{1}{2}e^{2t}(e^{3jt}+e^{-3jt}) = \frac{1}{2}(e^{(2+3j)t} + e^{(2-3j)t})$
the complex frequencies thus are $2+j3$ and $2-j3$.

(d) e^{-2t}
clearly the complex frequency is -2.

(e) e^{2t}
the complex frequency is 2.

(f) 5
It is a DC signal, hence the frequency is 0.

The complex frequencies are plotted in the complex plane below.



Solution 6

The power of signal $x(t)$ can be calculated as

$$P_x = \lim_{T\to\infty} \frac{1}{T}\int_{t=-T/2}^{T/2} |x(t)|^2 dt$$

For a periodic signal with period T this may be just computed over a time period as:

$$P_x = \frac{1}{T}\int_{t=0}^{T} |x(t)|^2 dt$$

and the RMS value is the square-root of P_x

(a) For the signal $x(t) = \sum_{k=m}^{n} D_k e^{j\omega_k t}$ (periodic with period T), the power can be calculated as

$$\begin{aligned}
P_x &= \frac{1}{T}\int_{t=-T/2}^{T/2} x(t)x^*(t)dt \qquad (\because |x(t)|^2 = x(t)x^*(t)) \\
&= \frac{1}{T}\int_{t=-T/2}^{T/2} \sum_{k=1}^{n} D_k e^{j\omega_k t} \sum_{k=1}^{n} D_k^* e^{-j\omega_k t} dt \\
&= \frac{1}{T}\int_{t=-T/2}^{T/2} \sum_{k=1}^{n} D_k D_k^* e^{j(\omega_k-\omega_k)t} dt \\
&\qquad + \frac{1}{T}\sum_{k=1}^{n}\sum_{l=1;k\neq l}^{n} D_k D_l^* \int_{t=-T/2}^{T/2} e^{j(\omega_k-\omega_l)t} dt \\
&= \frac{1}{T} * T \sum_{k=1}^{n} D_k D_k^* \\
&\qquad + \frac{1}{T}\sum_{k=1}^{n}\sum_{l=1;k\neq l}^{n} D_k D_l^* \int_{t=-T/2}^{T/2} e^{j(\omega_k-\omega_l)t} dt \\
&= \sum_{k=1}^{n} |D_k|^2 \qquad (\because \int_{t=-T/2}^{T/2} e^{j(\omega_k-\omega_l)t} dt = 0)
\end{aligned}$$

The frequencies are distinct and hence the sinusoids are orthogonal and when you integrate $e^{j(\omega_k-\omega_l)t}$ over the period T gives you zero.

(b) (a) $x(t) = 10cos(5t)cos(10t)$

$$\begin{aligned} x(t) &= 2.5(e^{j5t}+e^{-j5t})(e^{j10t}+e^{-j10t}) \\ &= 2.5(e^{j15t}+e^{-j5t}+e^{j5t}+e^{-j15t}) \end{aligned}$$

From the above expression, power can be calculated as:

$$P_x = 2.5^2 \times 4 = 25$$

(b) $x(t) = 10\cos(100t+\frac{\pi}{3})+5\sin(100t+\frac{\pi}{6})$

$$\begin{aligned} x(t) &= 5(e^{j(100t+\frac{\pi}{3})}+e^{-j(100t+\frac{\pi}{3})}) \\ &\quad -2.5j(e^{j(100t+\frac{\pi}{6})}-e^{-j(100t+\frac{\pi}{6})}) \\ &= 5(e^{j(100t+\frac{\pi}{3})}+e^{-j(100t+\frac{\pi}{3})}) \\ &\quad +2.5(e^{j(100t+\frac{\pi}{6}-\frac{\pi}{2})}-e^{-j(100t+\frac{\pi}{6}+\frac{\pi}{2})}) \\ &= (5e^{j\frac{\pi}{3}}+2.5e^{-j\frac{\pi}{3}})e^{j100t} \\ &\quad +(5e^{-j\frac{\pi}{3}}+2.5e^{j\frac{\pi}{3}})e^{-j100t} \end{aligned}$$

Power:

$$\begin{aligned} P_x &= 2|5e^{j\frac{\pi}{3}}+2.5e^{-j\frac{\pi}{3}})|^2 \\ &= 2\times\frac{75}{4} \\ &= 37.5 \end{aligned}$$

Solution 7

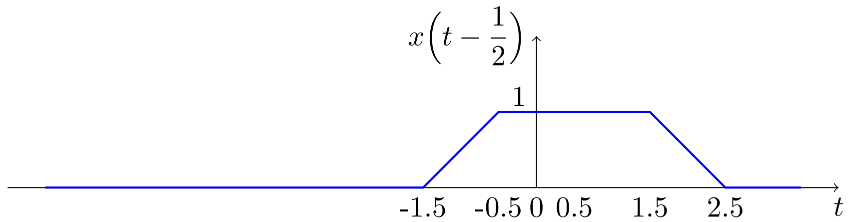
Any signal $x(at+b)$ can be obtained from $x(t)$ in 2 ways

(i) First shifting, then scaling
Find $x(t+b)$ first then replace t with at to obtain $x(at+b)$

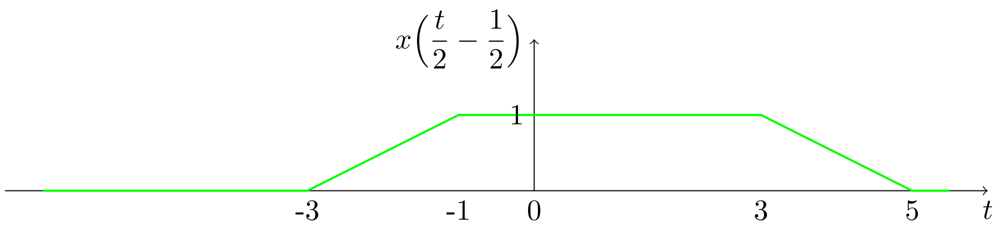
(ii) First scaling, then shifting
$x(at+b) = x(a(t+b/a))$ Find $x(at)$ first then shift left/right depending on the sign of b/a to obtain $x(at+b)$

We shall follow the first method.

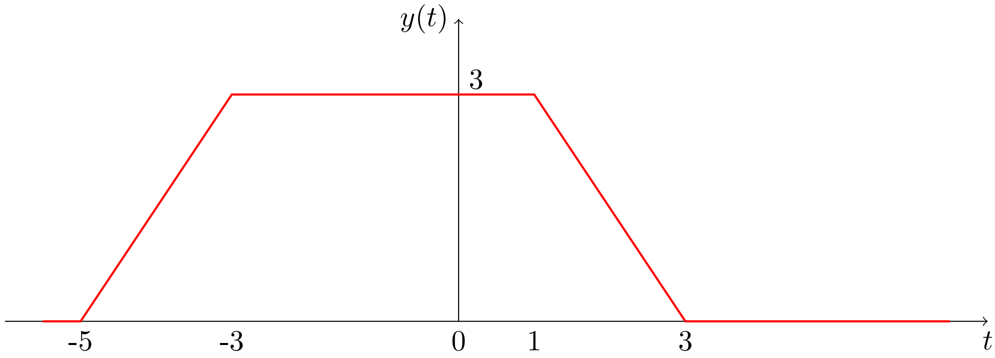
(a) $y(t) = 3x\Big(-\dfrac{1}{2}(t+1)\Big)$
$y(t) = 3x\Big(-\dfrac{1}{2}t-\dfrac{1}{2}\Big)$
First we will find $x\Big(t-\dfrac{1}{2}\Big)$
Here $a=-1/2, b=1/2$. Since b is positive, we should delay the signal or shift it towards right



Now replace t with $-\dfrac{1}{2}t$ in the above plot and redraw Since $a=-1/2$, it is a combination of scaling and reflection. We will do scaling with 1/2 first and then take the reflection about y-axis. Since $a=-1/2<1$, we should expand the signal.



Now take the reflection about y-axis to get $x\left(-\frac{t}{2}-\frac{1}{2}\right)$. Finally multiply the amplitude by 3 units to obtain $y(t)$



(b) The energy of a signal $x(t)$ can be calculated as

$$E_x = \int_{t=-\infty}^{\infty} |x(t)|^2 dt$$

The signal $y(t)$ can be expressed as $y(t) = y_1(t) + y_2(t) + y_3(t)$ where

$$y_1(t) = \frac{3}{2}(t+5), -5 \leq t \leq -3$$
$$y_2(t) = 3, -3 \leq t \leq 1$$
$$y_3(t) = -\frac{3}{2}(t-3), 1 \leq t \leq 3$$

Hence, Energy of $y(t)$

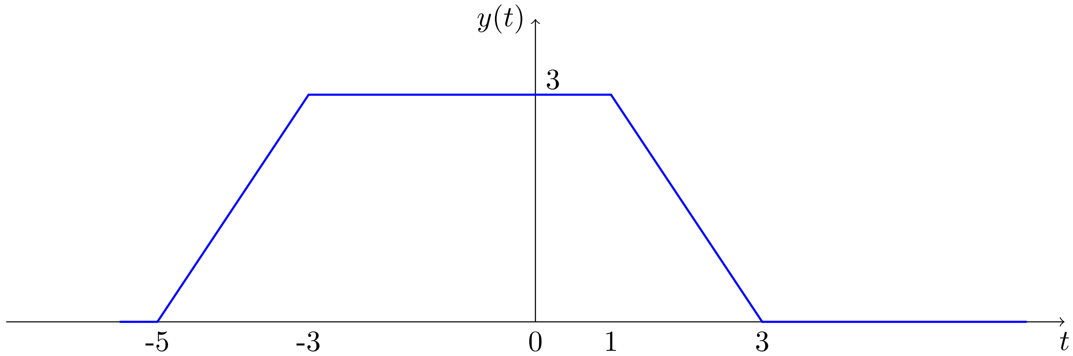
$$\begin{aligned} E_y &= \int_{-5}^{-3} |y_1(t)|^2 dt + \int_{-3}^{1} |y_2(t)|^2 dt + \int_{1}^{3} |y_3(t)|^2 dt \\ &= \int_{-5}^{-3} \left|\frac{3}{2}(t+5)\right|^2 dt + \int_{-3}^{1} |3|^2\, dt + \int_{1}^{3} \left|-\frac{3}{2}(t-1)\right|^2 dt \\ &= \frac{9}{4}\left|\frac{(t+5)^3}{3}\right|_{-5}^{-3} + |9t|_{-1}^{3} + \frac{9}{4}\left|\frac{(t-3)^3}{3}\right|_{1}^{3} \\ &= \frac{9}{4} \times \frac{8}{3} + 9 \times 4 + \frac{9}{4} \times \frac{8}{3} \\ &= 48 \end{aligned}$$

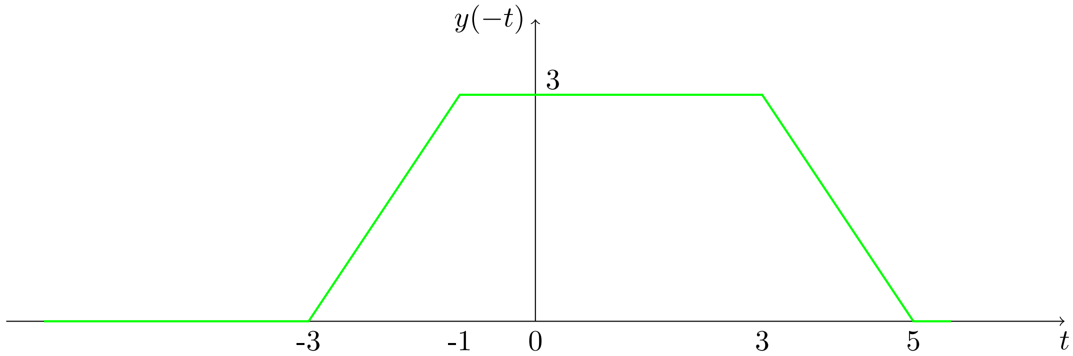
The power of a signal $x(t)$ can be calculated as

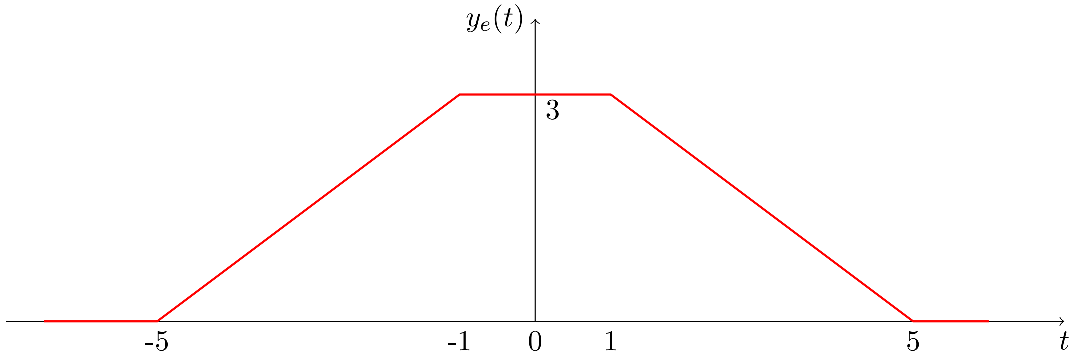
$$P_x = \lim_{T\to\infty} \frac{1}{2T} \int_{-T}^{T} |x(t)|^2 dt$$

Since the given signal is of finite duration and has finite energy, it is an energy signal. Hence the power is 0.

(c) Even portion of any signal $y(t)$ is found by $y_e(t) = \dfrac{y(t)+y(-t)}{2}$
$y(-t)$ is the reflection of $y(t)$ about y-axis. We will plot $y(-t)$ now.

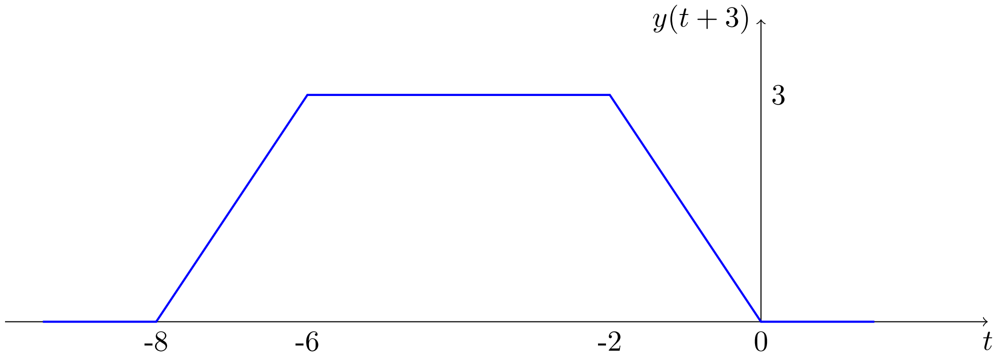


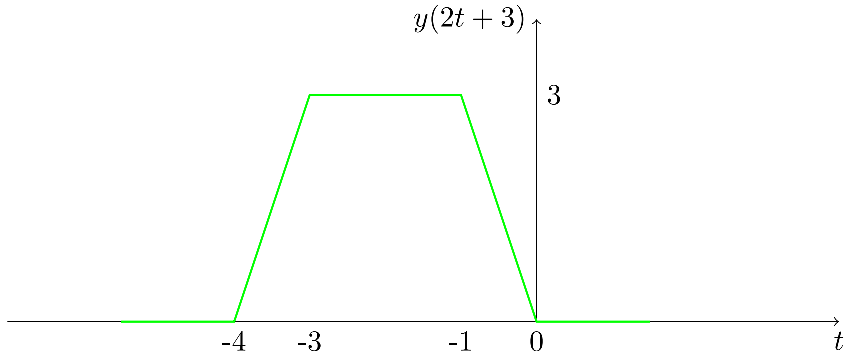




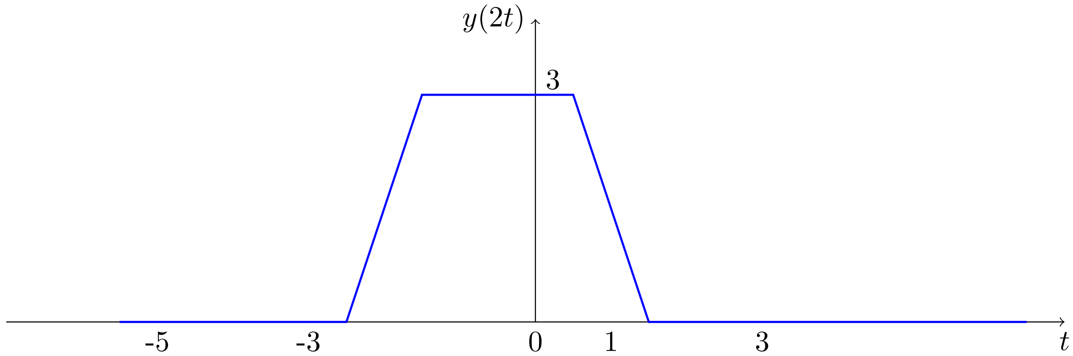
(d)

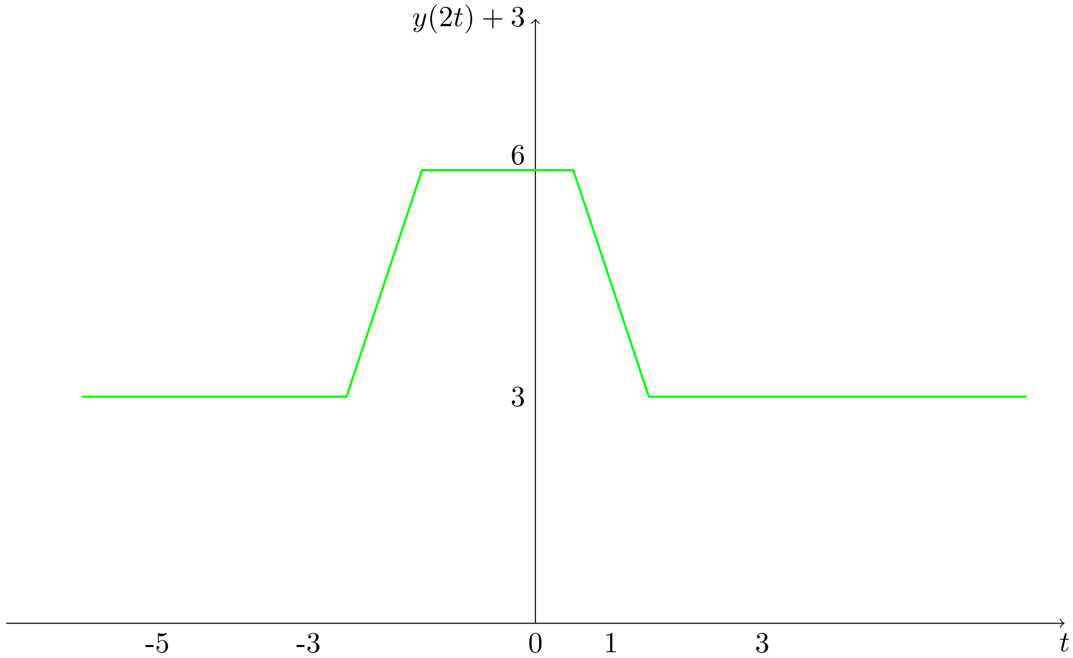
$$a = 2, b = 3$$
$$y(at + b) = y(2t + 3)$$



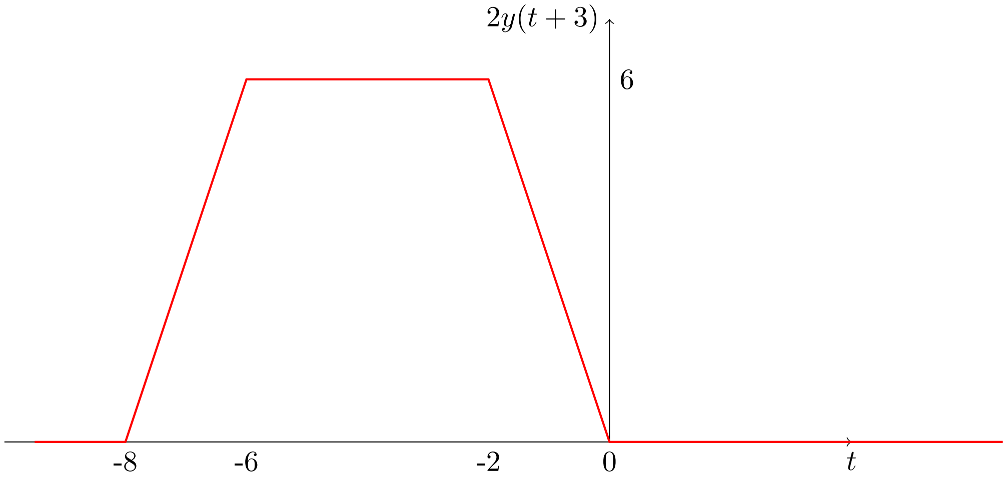


$y(2t) + 3$ is adding a dc value of 3 to $y(2t)$

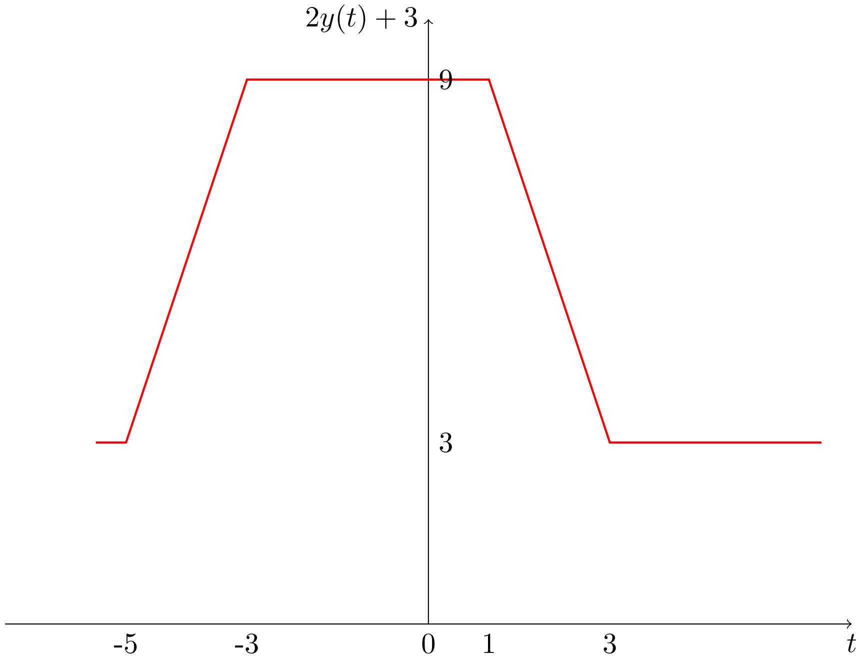




$2y(t+3)$



$2y(t)+3$ is adding a dc of 3 to $y(t)$



Solution 8

The energy of signal $x(t)$ can be calculated as

$$E_x = \int_{t=-\infty}^{\infty} |x(t)|^2 dt$$

(a) (i) The energy of signal $-x(t)$ can be calculated as

$$\begin{aligned} E_1 &= \int_{t=-\infty}^{\infty} \big|\big(-x(t)\big)\big|^2 dt \\ &= \int_{t=-\infty}^{\infty} |x(t)|^2 dt \\ &= E_x \end{aligned}$$

(ii) The energy of signal $x(-t)$ can be calculated as

$$E_2 = \int_{t=-\infty}^{\infty} |x(-t)|^2 dt$$

Let $\tau = -t \quad \Rightarrow d\tau = -dt$

$$\Rightarrow E_2 = -\int_{\tau=\infty}^{-\infty} |x(\tau)|^2 d\tau$$
$$= \int_{\tau=-\infty}^{\infty} |x(\tau)|^2 d\tau$$
$$= E_x$$

(iii) The energy of signal $x(t-T)$ can be calculated as

$$E_3 = \int_{t=-\infty}^{\infty} |x(t-T)|^2 dt$$

Let $\tau = t - T \quad \Rightarrow d\tau = dt$

$$\Rightarrow E_3 = \int_{\tau=-\infty-T}^{\infty+T} |x(\tau)|^2 d\tau$$
$$= \int_{\tau=-\infty}^{\infty} |x(\tau)|^2 d\tau$$
$$= E_x$$

(b) (i) The energy of signal $x(at)$ can be calculated as

$$E_1 = \int_{t=-\infty}^{\infty} |x(at)|^2 dt$$

Case 1: $a > 0 \Rightarrow a = |a|$

Let $\tau = at = |a|t \Rightarrow d\tau = |a|\ dt$

$$\Rightarrow E_1 = \frac{1}{|a|}\int_{\tau=-\infty}^{\infty} |x(\tau)|^2 d\tau$$
$$= \frac{E_x}{|a|}$$

Case 2: $a < 0 \Rightarrow a = -|a|$

Let $\tau = at = -|a|t \Rightarrow d\tau = -|a|\ dt$

$$\Rightarrow E_1 = -\frac{1}{|a|}\int_{\tau=\infty}^{-\infty} |x(\tau)|^2 d\tau$$
$$= \frac{1}{|a|}\int_{\tau=-\infty}^{\infty} |x(\tau)|^2 d\tau$$
$$= \frac{E_x}{|a|}$$

(ii) The energy of signal $x(at-b)$ can be calculated as

$$E_2 = \int_{t=-\infty}^{\infty} |x(at-b)|^2 dt$$

Case 1: $a > 0 \Rightarrow a = |a|$

Let $\tau = at - b = |a|t - b$

$$\Rightarrow d\tau = |a|\ dt$$
$$\Rightarrow E_2 = \frac{1}{|a|}\int_{\tau=-\infty}^{\infty} |x(\tau)|^2 d\tau$$
$$= \frac{E_x}{|a|}$$

Case 2: $a < 0 \Rightarrow a = -|a|$

Let $\tau = at - b = -|a|t - b$

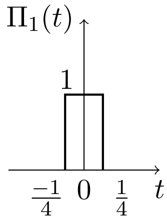
$$\Rightarrow d\tau = -|a|\ dt$$
$$\Rightarrow E_2 = -\frac{1}{|a|}\int_{\tau=\infty}^{-\infty} |x(\tau)|^2 d\tau$$
$$= \frac{1}{|a|}\int_{\tau=-\infty}^{\infty} |x(\tau)|^2 d\tau$$
$$= \frac{E_x}{|a|}$$

Solution 9

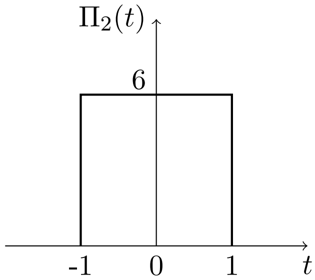
The energy of signal $\Pi(t)$ can be calculated as

$$E_\Pi = \int_{t=-\infty}^{\infty} |\Pi(t)|^2 dt$$

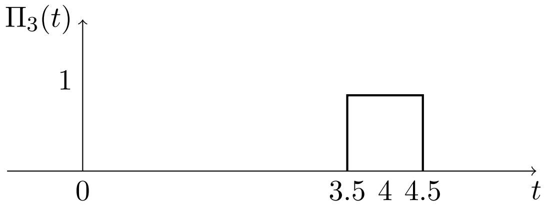
(a) $\Pi_1(t) = \Pi(2t)$
$E_{\Pi_1} = 0.5$



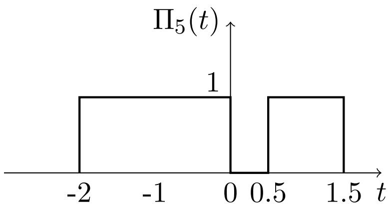
(b) $\Pi_2(t) = 6\Pi(0.5t)$
$E_{\Pi_2} = 72$



(c) $\Pi_3(t) = \Pi(t-4)$
$E_{\Pi_3} = 1$

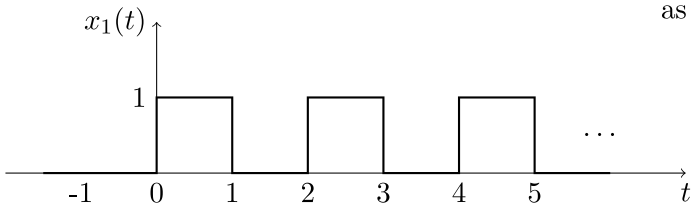


(d) $\Pi_5(t) = \Pi\left(\dfrac{t+1}{2}\right) + \Pi(t-1)$
$E_{\Pi_5} = 3$



Solution 10

(a) The binary signal $x_1(t)$ can be plotted as shown below:



Energy of the signal

The energy of signal $x_1(t)$ can be evaluated as:

$$
\begin{aligned}
E_1 &= \int_{t=-\infty}^{\infty} |x_1(t)|^2 dt \\
&= \int_{t=0}^{\infty} |x_1(t)|^2 dt \qquad (\because x_1(t) = 0, t < 0) \\
&= \int_{t=0}^{1} 1 \cdot dt + \int_{t=1}^{2} 0 \cdot dt + \int_{t=2}^{3} 1 \cdot dt + \int_{t=3}^{4} 0 \cdot dt + \cdots \\
&= 1 + 0 + 1 + 0 + \cdots \\
&= \infty.
\end{aligned}
$$

Power of the signal

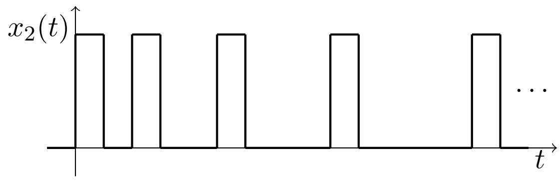
The power of the signal $x_1(t)$ can be evaluated as:

$$
\begin{aligned}
P_1 &= \lim_{T\to\infty} \frac{\int_{t=-T}^{T} |x_1(t)|^2 dt}{2T} \\
&= \lim_{T\to\infty} \frac{1}{2} \frac{\int_{t=0}^{T} |x_1(t)|^2 dt}{T}
\end{aligned}
$$

Consider N pulses. The time elapsed would then be $T = 2N$.

$$
\begin{aligned}
\therefore P_1 &= \lim_{N\to\infty} \frac{1}{2} \frac{N}{2N} \\
&= \frac{1}{4}
\end{aligned}
$$

(b) The binary signal $x_2(t)$ can be plotted as shown below:



Energy of the signal

The energy of signal $x_2(t)$ can be calculated as follows:

$$
\begin{aligned}
E_2 &= \int_{t=0}^{\infty} |x_2(t)|^2 dt \\
&= \int_{t=0}^{1} 1 \cdot dt + \int_{t=1}^{2} 0 \cdot dt \\
&\quad + \int_{t=2}^{3} 1 \cdot dt + \int_{t=3}^{5} 0 \cdot dt + \cdots \\
&= 1 + 0 + 1 + 0 + \cdots \infty \\
&= \infty
\end{aligned}
$$

Power of the signal

The power of signal $x_2(t)$ can be calculated as follows:

$$
\begin{aligned}
P_2 &= \lim_{T\to\infty} \frac{\int_{t=-T}^{T} |x_2(t)|^2 dt}{2T} \\
&= \lim_{T\to\infty} \frac{1}{2} \frac{\int_{t=0}^{T} |x_2(t)|^2 dt}{T}
\end{aligned}
$$

Consider N pulses. The time elapsed would then be $T = N + (1 + 2 + 3 + \cdots + N)$, i.e.

$$T = N + \frac{N(N+1)}{2}$$

$$\begin{aligned}
\therefore P_2 &= \lim_{N\to\infty} \frac{1}{2} \frac{N}{N + \frac{N(N+1)}{2}} \\
&= \lim_{N\to\infty} \frac{1}{2} \frac{N}{\frac{N(N+3)}{2}} \\
&= \lim_{N\to\infty} \frac{1}{N+3} \\
&= 0
\end{aligned}$$

Solution 11

A continuous time signal $x(t)$ is periodic if and only if $x(t) = x(t+T)$.
Power of the periodic signal can be evaluated as:

$$P = \frac{1}{T}\int_T |x(t)|^2 dt$$

(a) All continuous time sinusoidal and complex exponential are periodic.

$$\begin{aligned}
x(t) &= cos(\pi t) \\
\omega &= \frac{2\pi}{T} = \pi \\
T &= 2
\end{aligned}$$

Corresponding power is P = 0.5.

(b)

$$\begin{aligned}
x(t) &= A\sin(10t) \\
\omega &= \frac{2}{T} = 10 \\
T &= \frac{0.2}{\pi}
\end{aligned}$$

Corresponding power is P = $\frac{A^2}{2}$.

(c)

$$\begin{aligned}
x(t) &= \sin(\sqrt{3}\pi t) \\
\omega &= \frac{2\pi}{T} = \sqrt{3}\pi \\
T &= \frac{2}{\sqrt{3}}
\end{aligned}$$

Corresponding power is P = 0.5.

(d)

$$\begin{aligned}
x(t) &= e^{jt} \\
\omega &= 1 \\
T &= 2\pi
\end{aligned}$$

Corresponding power is P = 1.

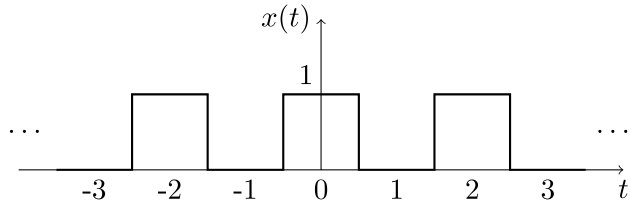
(e)

$$\begin{aligned}
x(t) &= A\sin(4\pi t + \pi) \\
\omega &= \frac{2\pi}{T} = 4\pi \\
T &= 0.5
\end{aligned}$$

Corresponding power is P = $\frac{A^2}{2}$.

(f)

$$\begin{aligned}
x(t) &= \sum_{n=-\infty}^{\infty} \Pi(t-2n) \\
&= \cdots + \Pi(t+4) + \Pi(t+2) + \Pi(t) \\
&\quad + \Pi(t-2) + \Pi(t-4) + \cdots
\end{aligned}$$



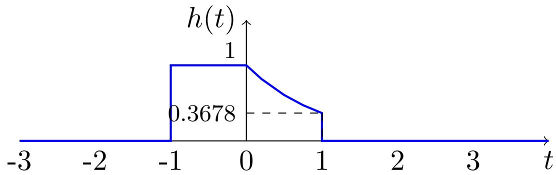
From the figure, it can be observed that T = 2.
Corresponding power is P = 0.5.

Solution 12

(a)

$$h(t) = \exp(-tu(t))$$

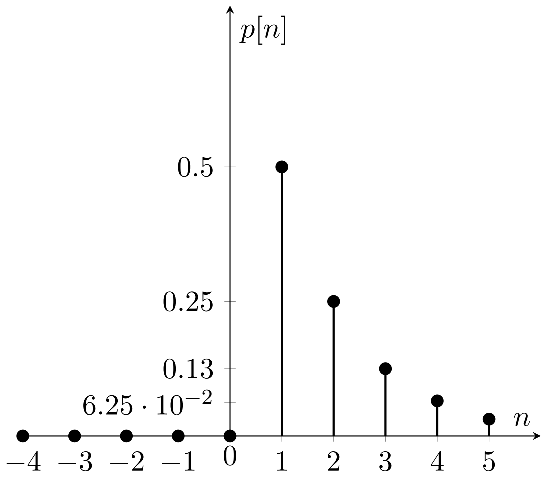
The power of exponential is zero till $t \le 0$. So, h(t) is 1 till $t \le 0$. For $t > 0$, h(t) is an exponentially decaying signal. The plot of h(t) is shown below.



(b)

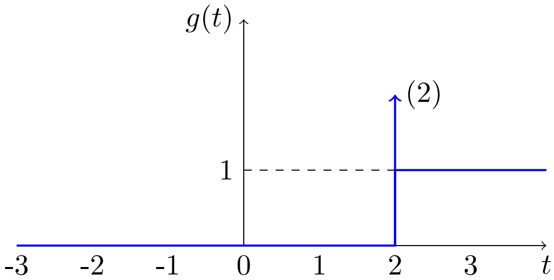
$$p[n] = \frac{1}{2}^n u[n-1]$$

$p[n]$ is a discrete time sequence which is zero for $n \le 0$ and is an exponentially decaying sequence for $n \ge 1$. The plot is shown below.



(c)

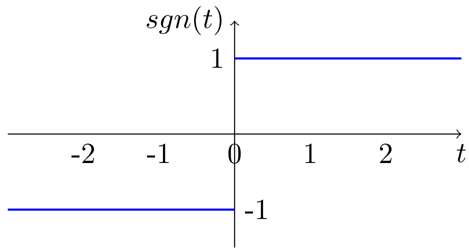
$$\begin{aligned}
g(t) &= \frac{d}{dt}\big(u(t-2)r(t)\big)\\
&= r(t)\frac{d}{dt}\big(u(t-2)\big) + u(t-2)\frac{dr(t)}{dt}\\
&= r(t)\delta(t-2) + u(t-2)u(t)\\
&= r(2)\delta(t-2) + u(t-2)\\
&= 2\delta(t-2) + u(t-2)
\end{aligned}$$



(d)

$$f(t) = sgn(e^{-2t}\sin \pi t)$$

The function $sgn(t)$ can be plotted as shown below:



$e^{-2t}\sin \pi t$ oscillates with a period of $T = 2$. Hence the signal $f(t)$ can be plotted as shown below:
